DESCRIPTORS: *Geophysical prospecting, *Well logging, Radioactivity, Sedimentary rock, Geology, *Radiation measurement systems,

To survey the distribution of radioactivity intensity, making use of existing deep drill holes in the regions of sedimentary rocks, a large size logger was manufactured, and the method of measurement and analysis of the obtained values was studied. Experimental logging was carried out in the Joban district, but no anomaly of radioactivity intensity was recognized. (Author)

If in the presence of a third element in an alloy the expulsion rate of the volatile component is increased, then the compression of the sample is reduced and the total pore volume is increased. If the expulsion rate is reduced in the presence of the third element, the compression of the sample increases and the total porosity decreases. The parallelism between the influence of the third element on the expulsion rate and the structure of the specimen attest that the expulsion of the volatile component from solid solutions is a (Chemistry--Physical, TT, v. 5, no. 9) (over)
